Network Troubleshooting

```
Network Troubleshooting:
    There are several ways we can gather information to troubleshoot
networking issues.
        docker logs CONTAINER  ==> Get container logs
     docker service logs SERVICE ==> Get collated logs from the tasks of
a service
      journalctl -u docker ==> Get Docker Daemon logs.

    another way to troubleshoot network issues is to run a container
within the context of a Docker Network. we can use it to test
connectivity and gather information.

    Netshoot is an image that come with a variety of network
troubleshoot tools.
    we can run netshoot by using the container image nicolaka/netshoot
    we can even run netshoot within the network namespace of an existing
container!
